

Risks: Assess possible problems with development of the software

- Email functionality: Has been troublesome to implement in the past, but probably doable nonetheless.
- "Student demographics and background": Will need to meet with the client in order to pin down what information we're wanted to implement in a student's entry. Can be cleared up upon first meeting.
- Course tracking: We would have to be careful as to how we implement the tracking system, so that a student taking a different chemistry course does not add to the total attempts in another class, for example. I imagine that should be doable as well.
- U of M security policies and FERPA: Underlying all of this is the need for the application to adhere to a set of guidelines I'm not familiar with at this time. Should be doable, but the specifics are still unknown at this time.

Database security

Making sure that database is secure
